

IN THE CLAIMS:

Please amend Claim 80 as follows:

80. A method for locating a wireless mobile station, comprising:  
receiving first data related to wireless signals communicated between a particular mobile station and at least a first network of a plurality of commercial mobile service provider networks, wherein for each said network, there are a plurality of base stations for at least one of transmitting and receiving wireless signals with a corresponding plurality of mobile stations registered with the network, and wherein said particular mobile station is registered with said first network for subscribing to a wireless service;  
first requesting a first location estimate of the particular mobile station, wherein a first location estimator provides said first location estimate of the particular mobile station when said first location estimator is supplied with first location information including data obtained using the first data, said location information capable of changing with a change in a location of the particular mobile station;  
wherein when said first location estimate is one of: (a) deemed ambiguous, (b) can not be provided, (c) is not within a desired range of accuracy, and (d) has an extent greater than or equal to a predetermined size, then the steps (A1) and (A2) are performed:  
(A1) instructing said particular mobile station to communicate with a second network of the plurality of networks for supplying second data, wherein said particular mobile station is not registered with said second network for subscribing to a wireless service, and wherein said second data is obtained using wireless signals communicated between the particular mobile station and the second network;  
(A2) second requesting a second location estimate of said particular mobile station wherein said second location estimate is obtained using additional location information obtained at least in part from the second data;  
outputting at least one of the first and second estimates of the location of the mobile station as an estimate of the location of the mobile station.

Please add the following new Claim 89:

Sub E' 10 89. A method for locating a wireless mobile station, comprising:  
receiving data indicative of wireless signal measurements obtained via wireless  
signals communicated between a particular mobile station and a plurality of  
communication stations of a wireless infrastructure operated by a commercial radio service  
provider, wherein said particular mobile station is not registered with said commercial  
radio service provider;  
wherein each of said communications stations includes one or more of a transmitter and a  
receiver for wirelessly communicating with said particular mobile station;  
wherein said data includes information that is dependent upon a location of each  
of at least a first and a second of said plurality of communication stations;  
determining, using at least said information, an estimate of a location, L, of said  
particular mobile station;  
wherein said step of determining includes performing a substep of obtaining at  
least (a) and (b) following: (a) first location data indicative of a first range of locations for  
L relative to said first communication station, and (b) second location data indicative of a  
second range of locations for L relative to said second communication station.
